

1 2. (Original) The method of claim 1, wherein the one or more rules
2 relate to a schema of the XML data stream.

3
4 3. (Original) The method of claim 1, wherein:
5 the defining of the plurality of states comprises defining one or more
6 schema modules that are configured to track one or more states of the XML data
7 stream; and

8 the evaluating comprises using the one or more schema modules to evaluate
9 the XML data stream against one or more schema-based rules.

10
11 4. (Original) The method of claim 1, wherein the defining of the
12 plurality of states comprises defining one or more schema modules that are
13 configured to track one or more states of the XML data stream, each schema
14 module being associated with at least one request type that defines the XML data
15 stream.

16
17 5. (Original) The method of claim 4, wherein the request type is a
18 WebDAV request type.

19
20 6. (Original) The method of claim 5, wherein the WebDAV request
21 type is a PROPFIND request.

22
23 7. (Original) The method of claim 5, wherein the WebDAV request
24 type is a PROPPATCH request.

1 8. (Original) The method of claim 5, wherein the WebDAV request
2 type is a SEARCH request.

3
4 9. (Original) The method of claim 5, wherein the WebDAV request
5 type is one of a LOCK and UNLOCK request.

6
7 10. (Original) The method of claim 1 further comprising defining one or
8 more rules that relate to an element's contents.

9
10 11. (Original) The method of claim 10, wherein said one or more rules
11 that relate to an element's contents define which elements can be contained within
12 other elements.

13
14 12. (Original) The method of claim 11, wherein if a rule that defines
15 which elements can be contained within other elements is violated, disregarding
16 associated portions of the XML data stream until a close tag is received for an
17 element that violates the rule.

18
19 13. (Original) A computer-readable medium having a program thereon
20 which, when executed by a computer, performs the steps of claim 1.

21
22 14. (Original) A method of parsing an Extensible Markup Language
23 (XML) data stream comprising:

24 defining a schema module that is associated with an HTTP request type that
25 is received from a client, the schema module having a function that determines

1 whether an XML data stream conforms to a given schema that is associated with
2 the HTTP request type;

3 evaluating an XML data stream with the schema module; and

4 disregarding a portion of the XML data stream if it does not conform to the
5 given schema.

6
7 15. (Original) The method of claim 14, wherein said defining of the
8 schema module comprises defining a plurality of schema modules, individual
9 schema modules being associated with different HTTP request types.

10
11 16. (Original) The method of claim 14, wherein said function determines
12 whether there are any unauthorized elements that appear in a client's request.

13
14 17 (Original) The method of claim 14, wherein said function determines
15 whether there are any unauthorized elements that appear in a client's request; said
16 disregarding comprising disregarding said XML data stream portion until a close
17 tag is received for an unauthorized element.

18
19 18. (Original) The method of claim 14, wherein said HTTP request type
20 comprises a WebDAV request type.

21
22 19. (Original) The method of claim 18, wherein said WebDAV request
23 type comprises a PROPFIND request.

24
25 20. (Original) The method of claim 18, wherein said WebDAV request
type comprises a PROPPATCH request.

1
2 21. (Original) The method of claim 18, wherein said WebDAV request
3 type comprises a SEARCH request.
4

5 22. (Original) The method of claim 18, wherein said WebDAV request
6 type comprises one of a LOCK and UNLOCK request.
7

8 23. (Original) A computer-readable medium having a program thereon
9 which, when executed by a computer, performs the steps of claim 14.
10

11 24. (Original) An Extensible Markup Language (XML) parsing system
12 comprising:
13

14 a parser configured to receive an XML data stream and generate a series of
15 calls as it parses the XML data stream;

16 a node factory communicatively associated with the parser and configured
17 to receive the parser's calls and responsive thereto construct a representation of the
18 XML data stream that the parser is parsing; and

19 a schema module communicatively associated with the node factory and
20 configured to evaluate the node factory's representation of the XML data stream
21 and determine whether it conforms to a known schema.
22

23 25. (Original) The parsing system of claim 24, wherein said parsing
24 system comprises a plurality of schema modules, each schema module being
25 associated with a different known schema.

1 26. (Original) The parsing system of claim 24, wherein the schema
2 module corresponds to an HTTP request type.

3
4 27. (Original) The parsing system of claim 24, wherein said parsing
5 system comprises a plurality of schema modules, each schema module being
6 associated with a different known schema and corresponding to a different HTTP
7 request type.

8
9 28. (Original) The parsing system of claim 27, wherein at least one of
10 the different HTTP request types is a WebDAV request.

11
12 29. (Original) The parsing system of claim 24, wherein the schema
13 module is configured to ignore an XML data stream portion that does not conform
14 to the known schema.

15
16 30. (Original) An Extensible Markup Language (XML) parsing system
17 comprising:

18 a collection of schema modules, each of which being configured to evaluate
19 a different schema that is associated with an XML data stream; and

20 a plurality of states associated with each schema module, individual states
21 of a schema module defining a schema requirement relating to a particular element
22 that is evaluated by that schema module.

23
24 31. (Original) The parsing system of claim 30, wherein each schema
25 module is associated with a different HTTP request and is configured to evaluate a
schema that is associated with the HTTP request with which is it associated.

B1

1
2 32. (Original) The parsing system of claim 31, wherein at least one of
3 the HTTP requests is a WebDAV request.
4

5 33. (Original) The parsing system of claim 31, wherein each of the
6 HTTP requests is a WebDAV request.
